Las Vegas, June 17, 2009 – Genilogix, a leading application lifecycle management company, HP Software Platinum and VMware Enterprise Partner, has assembled a fast, easy way to accelerate implementation of HP SiteScope by creating a virtual appliance. Virtual appliances can be quickly added to any existing virtual infrastructure and with HP SiteScope preinstalled and running, there is zero installation time required. The virtual appliance is delivered in the industry standard Open Virtualization Format (OVF) that was developed by VMware and others.

“Virtualization of production monitoring solutions is growing at a rapid pace because of the trend towards greener operations from reduced hardware requirements. The delivery of HP SiteScope, preinstalled in a virtual appliance, is the future of software delivery and deployment”, says Chris Emerson, Practice Manager for Virtualization and Technical Support at Genilogix. “Our unique relationships with both HP and VMware make this a perfect opportunity to offer something new to save customers time and expense.”

The appliance running HP SiteScope delivers agentless monitoring that complements existing agent-based solutions to help you maintain the availability and performance of your distributed IT infrastructure. This proactive, Web-based solution provides a centralized view of your entire infrastructure without installing agents or software on production systems. You can gain the real-time information you need to verify operations, stay apprised of problems and quickly address bottlenecks.

“Customers can reduce the risk of downtime by maintaining the availability and performance of their distributed IT infrastructure,” says Shahar Erez, product marketing manager, Software & Solutions, HP. “The combination of the Genilogix appliance with HP SiteScope helps customers gain the real-time

information they need to verify operations, stay apprised of problems and quickly address bottlenecks.”
