

## Genilogix Announces VMware Lab Manager Add-In for HP Quality Center

**Blue Bell, Pennsylvania, July 11, 2007** – Genilogix, a leading software quality engineering company, an HP Elite alliance member and a VMware Enterprise partner, today announces the beta release of an add-in that integrates TestDirector for Quality Center 9.0 with the test lab virtualization tool, VMware Lab Manager 2.5.

The add-in allows users to automatically deploy and control virtual test environments in VMware Lab Manager directly from the HP Quality Center Test Lab module and also supports the HP Quality Center built-in execution flow designer and test execution scheduler. For customers who purchase either VMware Lab Manager or HP Quality Center licenses through Genilogix, the add-in will be provided free of charge.

Dan Chu, VMware's Vice President of Emerging Products and Markets, stated, "We are pleased that Genilogix has linked these two leading technologies. VMware Lab Manager addresses one of the more difficult problems in testing - the rapid creation and clean administration of complex, multi-tier environments needed for development and testing. This release of the add-in is designed to enable users of HP Quality Center to integrate virtual test environments into their existing processes, not only accelerating cycle times but also delivering significant IT cost savings as well."

"We've seen countless customers benefit from the way that HP Quality Center streamlines quality assurance processes. We think that virtualizing test environments is a natural step for organizations that have already benefited from automation," said Nate Stuyvesant, CTO of Genilogix. "Our add-in allows users to seamlessly leverage HP Quality Center to deploy and manage virtual machines with applications under test running inside. This represents a huge reduction in turnaround time to deploy test environments as well as a major savings in hardware and storage."

Genilogix provides expert quality assurance services leveraging the tool sets of its partners. The company develops extensions, protocols and add-ins that connect these products in unique ways to lower the overall costs associated with enterprise-wide testing. The beta version of the add-in is available immediately to Genilogix clients.

*Genilogix is an Inc 500 information technology company that optimizes quality, performance and availability in business application for Fortune 2000 companies. More information about Genilogix is available at <http://www.genilogix.com>.*
